# 1.1.48 Summary Release Notes
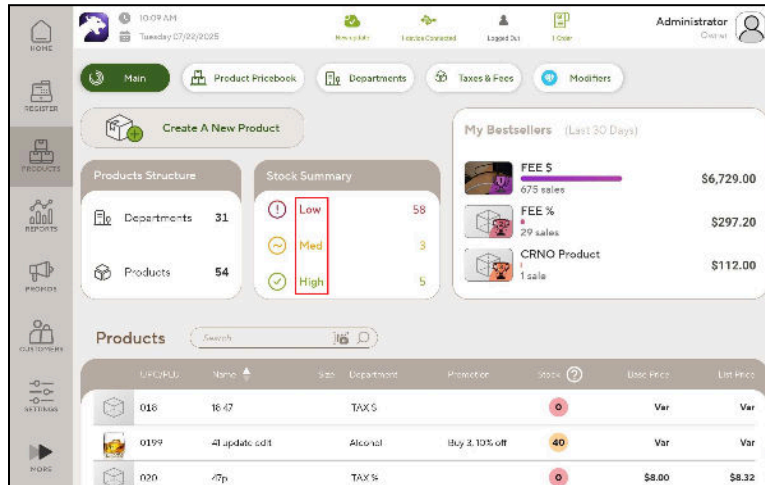

- **QSR Register Mode for Quick-service Restaurants**
  This update provides a new register layout purpose-built for counter-service environments. All non-basket functions (e.g., device management, clock-in/out) have been removed from QSR mode and can be accessed from settings. In addition, the UPC column has been dropped from the cart screen to give more space for product names and modifiers.

Pricing, taxation, register logic and reporting rules remain unchanged in the QSR Register mode.

- **Stock Edit Popup for Instant Inventory Corrections**

  Store managers can now click any stock-level category ("Low", "Med", "High") from the Products stock info dashboard to open an edit-in-place popup.

  Stock quantities are directly editable in the dialog, allowing immediate corrections without leaving the current screen. The popup pulls live stock quantities from the cloud and supports full offline operation.

- **Partial Promotion Indication Shows Customers How to Unlock Deals**

  The register now displays real-time prompts when a basket is close to qualifying for a promotion. For quantity-based promos, hints appear inline on each affected line item. This makes it easy for cashiers to suggest additional items and maximize promotional uptake.
